Patent Details:

Patent No	Kind	Lan	Pg	Main IPC	Filing Notes
JP 62081368	A		5		

Abstract (Basic): JP 62081368 A

Beta-lactam deriv. is selectively synthesised by treating lithium enolate of organic ester with organic imine cpd. in polar solvent.

As organic imine cpd. imine coordinated with trialkylaluminium may be used. When the cpd. is used as imine, cis prod. may be synthesised in high stereoselectivity of 100%.

USE/ADVANTAGE - Highly stereoselective synthesis of lactam derivs. Prods. are useful as pharmaceuticals.

Based on patent JP 6056770

Abstract (Basic): JP 6056770 A

Beta-lactam deriv. is obt'd. by reaction of a lithium enolate of an organic ester with an organic imine cpd. An imine coordinated with a trialkylaluminium is used as the organic imine cpd. and the reaction is carried out in THF.

ADVANTAGE - The prod. is prep'd. with high selectivity.

In an example, 12 mmol. of n-butyl lithium (15% hexane soln.) was added to 7 ml. of n-hexane soln. of 12 mmol. diisopropylamine while ice-cooling under N₂ stream. The mixt. was stirred for 30 min. and then n-hexane was distilled off in vacuo. 5 ml. THF was added to the residue and the mixt. was cooled to (-) 78 deg.C. 10 mmol. Of ethyl isobutyrate was added in 3 minutes and then THF soln. of 10 mmol. C₆H₅CH=NC₆H₅ and THF soln. of 10 mmol. Aluminium tri-acetate were added. The mixt. was heated gradually to room temp. in 2 hrs. It was hydrolysed with 1N HCl and the hydrolysate was extracted by benzene. Benzene was distilled off to give the beta-lactam. The yield was 75% and the cis-trans ratio was 100:0.
